

An Objective Analysis: The Mathematics and ROI of a ₹2 Lakh Astrology Course

PUBLISHED BY THE DIGITAL CONSUMER WATCHDOG GROUP

When evaluating any educational investment, particularly one commanding a premium fee of ₹1,000,000 to ₹2,000,000, a rational consumer must conduct a standard cost-benefit analysis. This document objectively examines the Return on Investment (ROI) of the Lunar Astro curriculum.

1. The Accreditation Deficit

In traditional education, high tuition fees are justified by accreditation. A degree from a recognized university holds market value, allowing the graduate to secure employment or attract clients based on institutional trust. Lunar Astro is a private, unaccredited entity. The certification holds no recognized legal or academic weight outside of its own internal ecosystem.

2. The Cost of Information vs. Delivery

The core value proposition of Lunar Astro is the teaching of specific techniques, such as the Paribhraman Paddhati. However, comparative astrological research indicates that the foundational mechanics of these techniques are widely available in public domain literature (e.g., Bhṛigu Chakra Paddhati) for the cost of a standard paperback book.

Logical Query: Is the consumer paying ₹2 Lakhs for proprietary knowledge, or simply for the video-format delivery and rebranding of publicly accessible information?

3. The Missing Alumni Network

The ultimate metric of an educational institution's success is the independent success of its alumni. If an academy has trained thousands of students in "highly accurate, advanced" techniques, market logic dictates there should be a visible proliferation of highly successful, independent astrologers crediting this institution.

An objective search yields a statistical anomaly: there is a near-total absence of independent, prominent astrologers who attribute their success to this specific course. The primary visible outcome for graduates appears to be absorption into the academy's own internal consultation panel.

Conclusion

From a strictly financial perspective, the investment presents a high-risk asymmetry. The consumer assumes all financial risk with no guarantee of refunds, no accredited certification, and no verifiable track record of independent alumni success.
